Phase 3 — the same picture, after the Safety Island

Same boxes and same colours as phase 2. **The Control stack and the Vehicle Interface move bodily to the island** — dashed red, from the ghost they leave behind. The island grows reduced versions of the other stacks (blue tag), the HPC gains an interface block, and one narrow link joins the two. Node-level detail is phase 4.

What changed

MIGRATED same Autoware stack, now on the island · NEW new — does not exist in Autoware today · RE-SOURCED stays, but its role or sources change · no longer on this ECU · the migration

The island is not a monitor bolted on the side: it runs a *reduced Autoware*. Its localization is one node, its planning is four bounded map-free ones — and its control stack is not a reimplementation at all, it is Autoware's, relocated. Phase 4 opens what changed to node level.
